

APPLICATION FOR PATENT

Inventor: Nir Hadar

Title: Knock-Down Crate with Walls Stored in Base and Method
Employing Such a Crate

5 FIELD AND BACKGROUND OF THE INVENTION

The present invention relates to crates and, in particular, it concerns a knock-down crate in which the walls can be stored in a recess in the base, and a corresponding method for transporting produce.

It is known to provide containers of many types for transporting
10 produce, manufactured articles, raw materials etc. from one location to another. Such containers are generally configured to be lifted by a fork-lift vehicle and are stackable. These containers, typically referred to as “bins”, “box-pallets”, “crates” or “totes”, will be referred to generically herein as “crates”.

In many cases, molded polymer containers are chosen for their light
15 weight, robustness and long usable lifetime. To realize the maximum strength of the polymer materials, polymer crates are often molded in a single piece. As a result, however, they occupy the same volume when transported empty on a return journey as when full on an outbound journey. This extremely inefficient use of space is very costly.

20 Various disassembling or foldable crates have been developed in an attempt to reduce the transport volume requirements when the crates are empty. All such crates which either disassemble (i.e., come apart into separate

elements) or fold (i.e., with all elements remaining interconnected) are referred to generically herein as “knock-down crates”. An example of a foldable crate may be found in U.S. Patent No. 5,094,356 to Miller. Examples of crates which disassemble may be found in U.S. Patent No. 5,638,973 to Dewey et al., U.S. Patent No. 6,142,329 to Dotan, and U.S. Patent Application Publication No. 2002/0084274 to Dotan. These publications are hereby incorporated by reference as if set forth entirely herein.

While offering more efficient use of volume, knock-down crates generally suffer from a number of disadvantages. Specifically with respect to crates which disassemble into separate elements, the base and the sides once separated are generally much less convenient to handle. Furthermore, the number of individual elements which must be handled is greatly increased, and considerable extra labor may be required for packing individual bases and sides compactly for volume-efficient transportation to the next point of use.

There is therefore a need for a knock-down crate in which the walls can be stored in a recess in the base for compact and convenient handling when unloaded.

SUMMARY OF THE INVENTION

The present invention is knock-down crate and a corresponding method for transporting produce.

According to the teachings of the present invention there is provided, a knock-down crate comprising: (a) a base having a length, a breadth, and an

upper surface; and (b) a first pair of sides detachably engageable with the base for deployment parallel to the length and a second pair of sides detachably engageable with the base for deployment parallel to the breadth, wherein the upper surface of the base features an elongated recess extending substantially the entirety of the length, the recess being sized for receiving the first and second pairs of sides such that, when the first and second pairs of sides are engaged with the base, the base and the sides define a four-sided crate with the recess contributing to an internal volume of the crate, and such that the first and second pairs of sides, when detached from the base, are receivable so as to be substantially contained within the recess for compact transportation.

According to a further feature of the present invention, the length is substantially equal to the breadth.

According to a further feature of the present invention, the first pair of sides and the second pair of sides are interchangeable.

According to a further feature of the present invention, the base and the first and second pairs of sides are all formed primarily from molded plastic material.

According to a further feature of the present invention, the base has a pair of elongated channels extending parallel to the length for receiving tines of a forklift mechanism.

According to a further feature of the present invention, a major part of the recess lies between the elongated channels.

According to a further feature of the present invention, the elongated recess is an open-ended recess extending the entirety of the length.

According to a further feature of the present invention, at least the second pair of sides each features a downwardly projecting tab configured to
5 substantially close an end of the open-ended recess when the side is engaged with the base.

According to a further feature of the present invention, the first pair of sides and the second pair of sides are interchangeable, the base including a pair of slots extending parallel to the length and configured for receiving the
10 downwardly projecting tab of the first pair of sides.

According to a further feature of the present invention, the elongated recess is a closed-ended recess terminating at two end walls.

According to a further feature of the present invention, each side of the first and second pair of sides has a length no greater than a length of the closed-
15 ended recess.

According to a further feature of the present invention, each side of the first and second pairs of sides includes attachment features for attachment to two adjacent sides, and wherein the attachment features are further configured such that each pair of the sides are doubly-interlockable to form a unit with the
20 pair of sides associated in close parallel relation.

According to a further feature of the present invention, upper and lower edges of the first and second pairs of sides and upper and lower peripheral regions of the base are formed with complementary alignment projections and

recesses such that, when the first and second pairs of sides are engaged with the base to form the four-sided crate, the alignment projections and recesses on the upper edges of the sides and on the lower peripheral region of the base serve to align the four-sided crate with similar crates placed above and below the four-sided crate, and when the first and second pairs of sides are received within the recess, the alignment projections and recesses on the upper and lower peripheral regions of the base serve to align the base with similar bases placed above and below the base.

There is also provided according to the teachings of the present invention, a method for using a knock-down crate to transport produce from a loading location to an unloading location, the method comprising the steps of: (a) providing a knock-down crate having: (i) a base with an upper surface including an elongated recess, and (ii) four sides deployable in a crate configuration wherein the four sides are engaged with the base and each other to form a four-sided crate, the four sides being further deployable in a knock-down configuration wherein the four sides are received substantially within the elongated recess; (b) deploying the crate in the crate configuration; (c) loading the crate at the loading location with produce, at least part of the produce lying within the elongated recess; (d) transporting the produce in the crate to the unloading location; (e) unloading the produce from the crate; and (f) deploying the crate in the knock-down configuration with the four sides located substantially within the elongated recess for transport to a next loading location.

According to a further feature of the present invention, upper and lower edges of the sides and upper and lower peripheral regions of the base are formed with complementary alignment projections and recesses, the method further comprising: (a) stacking the crate when in the crate configuration with
5 other similar crates such that the alignment projections and recesses on the upper edges of the sides and on the lower peripheral region of the base serve to align the crate with the other similar crates placed above and below the crate; and (b) stacking the crate when in the knock-down configuration with other similar crates such that the alignment projections and recesses on the upper and
10 lower peripheral regions of the base serve to align the crate with the other similar crates placed above and below the crate.

BRIEF DESCRIPTION OF THE DRAWINGS

The invention is herein described, by way of example only, with reference to the accompanying drawings, wherein:

15 FIGS. 1A and 1B are schematic isometric views of a base and a set of four sides, respectively, for use in a knock-down crate constructed and operative according to the teachings of the present invention;

FIG. 2 is a schematic isometric view of a four-sided crate constructed from the base and sides of Figures 1A and 1B;

20 FIG. 3 is a schematic isometric view showing the sides of Figure 1B received within a recess in the base of Figure 1A;

FIG. 4 is a schematic isometric view showing the interconnection of two of the sides of Figure 1B;

FIGS. 5A and 5B are schematic isometric views showing two of the sides of Figure 1B immediately prior to, and after, interconnection to form a two-side unit;

FIG. 6 is a schematic partially cut-away isometric view of the crate of the present invention during assembly or disassembly;

FIG. 7 is a schematic partially cut-away isometric view of the knocked-down crate of Figure 3;

FIGS. 8A and 8B are schematic isometric views of a base and a set of four sides, respectively, for use in a second embodiment of a knock-down crate constructed and operative according to the teachings of the present invention;

FIG. 9 is a schematic isometric view of a four-sided crate constructed from the base and sides of Figures 8A and 8B;

FIG. 10 is a schematic isometric view showing the sides of Figure 8B received within a recess in the base of Figure 8A;

FIG. 11 is a schematic cross-sectional view of the crate of Figure 2 or Figure 9 in use filled with produce;

FIG. 12 is a schematic cross-sectional view similar to Figure 11 showing the crate in its knocked-down configuration for return transport; and

FIGS. 13A-13C are schematic cross-sectional views showing stacking features of the crates of the present invention prior to assembly, when assembled, and when in the knocked-down state, respectively.

DESCRIPTION OF THE PREFERRED EMBODIMENTS

The present invention is a knock-down crate in which the walls can be stored in a recess in the base for compact and convenient handling when unloaded, and a corresponding method for transporting produce.

5 The principles and operation of knock-down crates according to the present invention may be better understood with reference to the drawings and the accompanying description.

Referring now to the drawings, Figures 1A-7 show a first preferred embodiment of a knock-down crate, generally designated **10**, constructed and
10 operative according to the teachings of the present invention. Generally speaking, crate **10** is formed from a base **12** and a set **14** of sides **16a**, **16b**, **16c** and **16d**. An upper surface **18** of base **12** features an elongated recess **20** extending substantially the entirety of a length **L** of the base and sized for receiving set of sides **14**.

15 The sides are configured to be detachably engageable with base **12** with a first pair **16a** and **16c** parallel to the length **L** of base **12** and a second pair **16b** and **16d** parallel to a breadth or width **W** of base **12** such that, when sides **16a**, **16b**, **16c** and **16d** are engaged with base **12**, the base and the sides define a four-sided crate **10** as shown in Figure 2 with recess **20** contributing to an
20 internal volume of the crate. When the crate is unloaded and the sides are detached from the base, the set **14** of sides **16a**, **16b**, **16c** and **16d** are received so as to be substantially contained within recess **20** to form the knocked-down configuration of Figure 3 for compact transportation.

It will be immediately appreciated that the crate of the present invention offers profound advantages over conventional knock-down crates. Specifically, in the assembled configuration of Figure 2, recess **20** contributes significantly to the usable internal volume of the crate, thereby maximizing transport
5 volume. In the knocked-down state of Figure 3, all parts of the crate are configured in a single compact block which is easily handled and can be efficiently stacked with other similar crates to ensure minimum volume for return transportation or storage of the crate when not in use. These and other advantages of the present invention will be better understood from the
10 following detailed description.

Turning now to the features of crate **10** in more detail, it is a preferred feature of certain implementations of the present invention that the crate is a square crate, i.e., that length L is substantially equal to breadth W . In most preferred cases, all four sides are then made interchangeable such that the user
15 can assemble the crate with each side located arbitrarily along any edge of the base.

In order to form a usable crate, it is clearly necessary to achieve load-bearing engagement between adjacent sides of the assembled crate and between each side and the base. Thus, each of sides **16a**, **16b**, **16c** and **16d** includes
20 attachment features **22**, **24** for attachment to two adjacent sides. Figure 4 illustrates two interconnected sides **16c** and **16d**, with their available attachment features clearly visible. The attachment features are shown here schematically as complementary rectangular-section interlocking tabs with

through-bores for receiving a bolt element to lock the sides together and to the base. Most preferably, attachment features 22, 24 are further configured such that pairs of the sides are doubly-interlockable to form a unit 14a with the pair of sides associated in close parallel relation. Figures 5A and 5B show such a unit 14a prior to and after interconnection. Figure 6 shows a cut-away view of crate 10 partially assembled with one unit 14a stored in recess 20. Two such units together make up an easily handled set 14 of sides for insertion into recess 20 as shown in Figure 7.

It should be appreciated that the attachment features shown here are represented schematically. Various engagement configurations for removably engaging sides with a base and with each other to form a knock-down crate are known in the art. The specific choice of engagement configuration, other than certain features discussed explicitly herein, does not constitute part of the present invention per se and for conciseness will not be described here in detail. By way of non-limiting examples, the various engagement and locking configurations described in the aforementioned U.S. Patent No. 6,142,329 to Dotan, and/or U.S. Patent Application Publication No. 2002/0084274 to Dotan are considered suitable for implementation of the present invention.

Optionally, a locking arrangement (not shown) may be provided to retain set of sides 14 within recess 20 to ensure that the set of sides do not become dislodged during handling. Most preferably, at least one locking element used for interlocking the sides when assembled also functions to selectively lock the set of sides within recess 20 when in the knock-down

configuration. Such an implementation is well within the capabilities of one ordinarily skilled in the art.

In most preferred implementations, base **12** and sides **16a**, **16b**, **16c** and **16d** are all formed primarily from molded plastic material. It should be noted, however, that implementations of the crate structure described using materials other than molded plastics also fall within the broad scope of the present invention. The various components of the crates of the present invention are illustrated here schematically and simplistically for clarity of presentation. The geometrical patterns shown here on the sides of the crates are non-functional and are included merely to facilitate visual differentiation between the inward-facing and outward-facing surfaces. It will be understood by one ordinarily skilled in the art that the various components will typically be implemented with various structures of reinforcing ribs and/or other functional or decorative features which do not per se constitute part of the present invention. Furthermore, depending upon the type of produce to be transported and the desired drainage characteristics of the crate, the base and walls may be made either solid or with drainage and ventilation openings, as is known in the art.

Crate **10** is preferably configured for handling by standard pallet handling equipment. To this end, base **12** preferably has a pair of elongated channels **26** extending parallel to length **L** for receiving tines of a forklift mechanism (forklift, pallet carrier etc.). Channels **26** typically extend along the entirety of length **L**, allowing insertion of tines from either end of the crate. Most preferably, at least a major portion of recess **20** is located between

channels 26. Thus, considered from a different point of view, crate 10 may be considered to have a thin base 12 in the region of recess 20, with locally raised regions to provide the volume required for channels 26. It will thus be understood that the usable volume of the inside of the crate is fully maximized by making all volume other than that required for channels 26 available for loading with produce. Furthermore, since the sides are stored between the regions of base 12 containing channels 26, nothing overlies the regions of the base 12 containing channels 26 in the collapsed state, making the height of the crate in its collapsed state significantly less than that of “fold-down” crates of similar dimensions.

According to the first preferred embodiment of the present invention shown here, elongated recess 20 is a closed-ended recess terminating at two end walls 28. As a result, the length of recess 20 is slightly less than the external length L of base 12. To ensure that sides 16a, 16b, 16c and 16d fit within recess 20, each side preferably includes one corner portion of the assembled crate, with part of the adjacent side or at least engagement features for the adjacent side extending laterally from the corner portion. As a result, the length of each side is less than the external length dimension of the assembled crate by the thickness of one corner portion, preferably at least equal to a thickness of the crate side. Thus, if end walls 28 have a thickness no more than about half the thickness of sides 16a, 16b, 16c and 16d, the sides can be accommodated within recess 20.

Turning now to Figures 8A-10, there is shown a second preferred embodiment of a crate, generally designated **100**, constructed and operative according to the teachings of the present invention. Crate **100** is structurally and functionally similar to crate **10** described above. For clarity and conciseness, features of crate **100** analogous to those of crate **10** are labeled with reference numerals greater by 100 than the numeral used for the analogous feature of crate **10**.

Crate **100** differs from crate **10** primarily in that recess **120** is here an open-ended recess extending the entirety of length **L**. In order to ensure closure of the sides of the assembled crate, at least one pair of sides **116b** and **116d** each features a downwardly projecting tab **130** configured to substantially close an end of recess **120** when the side is engaged with base **112** as shown in Figure 9. Most preferably, base **112** features an engagement indentation **132** (Figure 8A) across each end of recess **120** with which downwardly projecting tabs **130** engage when assembled to provide mechanical support to the tabs.

As mentioned earlier, it is considered advantageous that the crates of the present invention employ four interchangeable sides, thereby allowing a user to assemble the crate with each side engaged along an arbitrarily chosen edge of the base. Parenthetically, it should be noted that the term “interchangeable” as used herein refers to sides having functionally equivalent features to the extent that inadvertent swapping of two sides does not significantly impact the function of the assembled crate. Interchangeability does not necessarily imply that the sides are identical or indistinguishable.

In this embodiment, interchangeability of the sides may be achieved by providing a pair of slots 134 extending parallel to length L and configured for receiving downwardly projecting tabs 130 of the sides deployed parallel to length L. The engagement of tabs 130 within slots 134 also adds structural strength to the assembled crate. In order to allow sides 116a and 116c to be located at the outer edge of base 112, tabs 130 are most preferably slightly thinner than the main upper portion of the sides and slightly set back from the plane of the outer surface of the side.

Clearly, in an alternative implementation (not shown), tabs 130 may have a thickness equal to that of the main upper portion of the sides, the tabs being received in a corresponding external recess formed in the external surfaces of the base parallel to the length L.

In all other respects, the structure and function of crate 100 will be understood by analogy to that of crate 10 described herein.

Referring now again generically to both embodiments of a crate according to the teachings of the present invention, the sides and base are preferably configured to allow stacking of the crate with other similar crates in both the assembled crate configuration and the knock-down compact configuration. To this end, the upper and lower edges of sides 16a, 16b, 16c and 16d, and upper and lower peripheral regions of base 112 are preferably formed with complementary alignment projections 200 and recesses 202 (Figure 13A). Alignment projections 200 and recesses 202 are positioned and configured such that, when the sides are engaged with the base to form the

four-sided crate (Figure 13B), alignment projections 200 and recesses 202 on the upper edges of the sides and on the lower peripheral region of the base serve to align the four-sided crate with similar crates (not shown) placed above and below the crate, and when the sides are received within recess 20 (Figure 5 13C), alignment projections 200 and recesses 202 on the upper and lower peripheral regions of the base serve to align the base with similar bases (not shown) placed above and below the base.

At this point, the use of crates 10 and 100 will be clearly understood. Specifically, the crate is deployed in its deployed “crate configuration” and loaded with produce at a loading location. It will be noted that, as shown in 10 Figure 11, at least part of the produce 204 lies within the elongated recess 20, thereby contributing to the total volume of produce which can be transported within the crate. Then, after transporting the produce in the crate to an unloading location, the produce is unloaded from the crate and the crate is 15 disassembled and the walls stored in the recess to produce the “knock-down configuration” as shown in Figure 12. The crate is then compact and conveniently handled, with the four sides located substantially within elongated recess 20, for transport to a next loading location. Most preferably, in a crate having alignment features as described with reference to Figures 13A-13C, the 20 crate is stacked with other similar crates when in the crate configuration such that the alignment projections and recesses on the upper edges of the sides and on the lower peripheral region of the base serve to align the crate with the other similar crates placed above and below the crate, and is stacked when in the

knock-down configuration with other similar crates such that the alignment projections and recesses on the upper and lower peripheral regions of the base serve to align the crate with the other similar crates placed above and below the crate.

- 5 It will be appreciated that the above descriptions are intended only to serve as examples, and that many other embodiments are possible within the scope of the present invention as defined in the appended claims.
